No. is the number of results predicted by chance to have score greater than or equal to the score of the result being put and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB seq

This encoded protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFIIIO5 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for hTAFIIIO5 transcripts), therapy (e.g. gene therapy to modulate hTAFIIIO5 gene expression) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating B cell specific activators or other transcriptional regulators).

                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                         CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO CC at fits wipo, int/pub/vibulished port sequences.

This represents a polypeptide comprising a (modified) fragment (I) a TATA box-binding protein associated factor II 105 (TAFIIIO5). A pharmaceutical composition comprising (I) or the polynucleotide or inhibitor or antagonist of (I) is useful for treating cancers and
                                                       Polypeptide encoding TATA box binding protein associated factor useful for treating e.g. cancers and inducing apoptosis has a do negative effect on the normal biological activity of the binding protein -

                                                                                                                                                                                                                                                                                            by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFS. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the corresponens from lambda-gtll expression libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-JAN-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of the human TATA-binding protein (TBP) associated factor (TAF) designated TAFIII30. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol wt. of 130 kD by SDS-PAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Comai

TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typical a protein like TBP or another TAF, an activator, or DNA.

                                                                                                                                                                                                                                                                                                                                                         Ŷ
                                                                                                                                                                                                                                                                                                                                                                                                                                                     compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcription. The proteins tested in the cinvention include RPC34, POP3, TRA2, NAB2, MP71, MTR2, BOS1, POL30, RSA2, SCT1, MTW1, TFB1, SPC99, BER2, RNA1, GCD7, SKI6, NIP1, LCP5, NCE103, CECO1, ORC2, CNS1, YPD1, TIM10 and SRB4 from S. cerevisiae, C. albicans and human homologues. The method involves contacting a culture with one or wast compounds and determining the effects on the growth or compounds and the centified compounds interact with one or yeast cells. Preferably the identified compounds interact with, or modulate (preferably inhibit) activity of C. albicans EP. The inhibitor compounds identified by the method are useful for preventing or inhibiting fungal, particularly C. albicans growth in culture or in a mammal. The antifungal agents interact with essential fungal elements that can be used to treat fungal infection by preventing the growth and preferentially killing the fungal infection by preventing the growth and contivity of mammalian homologues. This amino acid sequence represents a target protein used to test the antifungal compounds, described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (TBP) associated factor (TAF) designated TAFIII10. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. wt. of 110 kD by SDS-PAGE, a calculated mol. wt. The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFs. Purification of TSIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the corresp.

                                                                                                                                                                                                                                                                                                                                                                                                                          AAW25028 represents TATA-binding protein associated factor (TAF) polypeptide, dTAFIII10 (mol. weight 110kD). TAF peptides derived from dTAFII30 alpha, dTAFII30 beta, dTAFII40, dTAFII60, dTAFII60, dTAFII60, dTAFII10, dTAFII10, dTAFII10, and dTAFII250, their human equivalents and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,
                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding human TATA-binding protein associated (TAF) peptide(s) - for production of recombinant peptide(s), for modulating transcription of TAFs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-JUN-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US5637686-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drosophila sp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RNA polymerase initiation.

                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from brosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLJ01840-ABLJ6175) and the encoded proteins sequences (ABLJ01840-ABLJ6175) and the encoded proteins
                                                                                                                The sequence data for this patent did not form specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                      New isolated nucleic acid genes from Drosophila and interactions -

The inventuation of detecting 1000 or more genes from Drosophila. The inventual developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 24957; 21pp + Sequence Listing; English.

Epitopes of the encoded protein can be used in defining functional domains of HCF, identifying compounds that associate with HCF or designing compounds capable of modifying HCF transcription. Such agents can be used to treat viral infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes colon tumour associated proteins (I) and the polynucleotides (II) that encode them. (I) have cytostatic activity. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with happropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of TCAPs by expressing inactive proteins or to supplement the patients own production of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the nucleic acids into a host cell culturing the cell to express the protein. (II) and its

                                                                                                                                                                                                                                                                                                     (e.g.
                                                                                                                                                                                                                                                                                                                                        complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (PCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. (I) may also be used as antigens in the production of antibodies against TCAPs and in assays to identify modulators of TCAP expression and activity. Anti-(I) antibodies and antagonists may also be used to down regulate TCAP expression and activity. The anti-(I) antibodies may also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB07737-ABB72072).
